Abstract

invention relates to an electromigration test apparatus having a direct-current source 101 and an AC voltage source 102. Furthermore, it has a circuit 104 having a conductive structure 100, which electrically coupled to the direct-current source 101 and the AC voltage source 102, and a measuring device measuring electrical parameter an which indicative of electromigration the in conductive structure. The AC voltage source 102 is set up in such a way that it exposes the conductive structure 100 to an alternating current, independently of a current, and thus heats the conductive structure 100 to a predetermined temperature.
